

# Save the Date!

**Wednesday, July 18 - 7:00 pm**

Aldersgate United Methodist Church (Sanctuary)  
1201 Irvine Blvd., Tustin

## ***San Onofre Safety: A Matter of Right vs. Wrong***

Hear Gary Headrick, co-founder of San Clemente Green, tell the personal side of taking on an industry so deeply devoted to profit that it would risk all of creation to squeeze the last drop of profit from the innocent masses being misled by rumors of blackouts & given a false sense of security. The truth gets lost in a society distracted by economic hardship & the constant encouragement to leave it to “those in charge.”

Fukushima was (is) a crime against Nature that could have been prevented by “those in charge.” San Onofre is not far behind.

There is an important other side of the story that we must hear. Facts from independent nuclear experts & first hand experience with whistleblowers will provide a fresh perspective on the reality of living near an old nuclear power plant, surrounded by fault lines, in a tsunami zone. We’ve lived without nuclear power for more than five months now. Let’s find out what we can do to keep it that way.

Gary & his wife, Laurie, started San Clemente Green in 2007 to create a Sustainable Action Plan for their town. After unanimous approval by the city council in 2010 the Headricks intended to make their own home into a living example of sustainable living. While in the midst of that transition they were contacted by people who work at San Onofre that were afraid to report safety concerns for fear of retaliation from management. Some of those concerns raised had to do with the installation of the same steam generators that have caused the nuclear power plant to be closed since the beginning of this year. Suddenly they were thrust into an issue they never intended to take on. No one took the matter seriously, including the Nuclear Regulatory Commission, until 3/11/11, when Japan experienced the unpredictable forces of nature. Since then, Gary has been leading a coalition of groups raising public awareness of the dangers before any ill-informed decisions are made to restart the plant.
